Player, InputAdapter
and ANN

Evolve input neurons

- ▶ create initial population genomes (Bitstring)
- ▶ create phenotype according to genome
- ▶ play against other phenotypes/other players/original player
- ▶ evolve next generation (crossing, mutation, ..)

Our Implementation

- ▶ extend class NeuroPlayer (or subclass) or InputAdapter?
- ▶ implement deactivation of input features according to the genome
- ▶ how to ignore input features
 - ▶ NeuroPlayer: ANN.removeLink()
 - ▶ InputAdapter: set input feature to 0 (easy to implement but could cause problems)
- ▶ NeuroPlayer: keep reference to existing NeuroPlayer and forward all method calls (would work for all NeuroPlayers)
- ▶ evolution through existing evolution mechanism
